

May 2018 Sightings Report

After a cold March-April period, May jumped right to a warm 80 °F on the 1st. All but 3 days, May 10th-12th, averaged above normal, and the month ended the warmest May on record. Temperatures averaged 64.4 °F, 7.6° above normal. Still, there were only 2 records for the month, with a tie record high on the 2nd and a new record high low on the 31st. Precipitation totaled 1.70 inches, which is 1.17 inches below normal. Most of the rainfall occurred in the latter half of the month, with 0.52 inches on the 22nd. Also, most fell at night, so days were pleasant for outdoor activities including birding.

Again, nearly all expected lingering species of waterfowl were reported, but numbers generally were low and peak counts few and low. Among the missing species sometimes lingering into May were Tundra Swan and Canvasback. A Harlequin Duck was a bit late, but within historical dates. Loon and grebe numbers were again poor. Double-crested Cormorant numbers continued high, though the peak counts did not seem to reflect the large flock in Irondequoit Bay, and were not from there. The only real waterbird rarity was a Cattle Egret near Sodus, though there was a good number of other rarities just outside the region in the Montezuma complex.

The only two Black Vulture reports came from High Acres Nature Area and near Walworth. A Mississippi Kite was seen from the Braddock Bay hawk watch Frisbee Hill site on May 14th. There were no Northern Goshawk reports from the hawk watch and only one elsewhere. A special treat was a dark morph Broad-winged Hawk passing right overhead on the 21st. An immature light morph Swainson's Hawk was seen at the hawk watch on the 23rd. The hawk watch count for the month was plagued by NE winds and lake breezes, and there were only two 1,000-bird days after the 2nd. Still, 19,363 birds for the month was good and very close to last year's total. Turkey Vulture and Broad-winged Hawk numbers also fell close to last year's tallies. Bald Eagle was off a bit at 586 counted, but 115 on May 31st was a new record day-high.

Sandhill Crane numbers passing and at scattered sites were typical for recent years, but again there were no reports of pairs with young. Breeding has been confirmed in at least 3 areas in the past.

Shorebird habitat was again minimal in our region. While Lake Ontario was not as high as last year, the level remained nearly a foot above the recent "long-term" average and the lack of rainfall meant essentially no field puddles. Still, birders searching for birds added to those passing along the lakeshore or stopping on piers and beaches, produced a respectable 24 species, including the rare-in-spring American Golden-Plover, Piping Plover, and American Avocet. Also on the scarce but annual list were Willet and Whimbrel. On the 7th, a record high flock of 27 Willets dropped onto logs on Salmon Creek behind the old Docksidiers. Upland Sandpiper and Wilson's Phalarope, formerly regular but now sometimes missed, were also reported.

The usual gulls and terns were reported, with numbers back to more normal after the big gathering on Irondequoit Bay earlier. The usual "winter" gulls lingered to typical late May dates. Rarer gulls included only a single Little Gull at

Chimney Bluffs and an adult Laughing Gull at the East Spit of Braddock Bay. The usual terns were all noted with typical high counts. The local stronghold for Black Tern remains the Northern Montezuma Wildlife Management Area, with a peak count of 38 in the Van Dyne Spoor marshes.

Non-passerine land birds were again found as expected, with no really noteworthy records. There were no reports Eurasian Collared-Dove, cuckoo numbers were good, the Common Nighthawk maximum was only 42, and Eastern Whip-poor-will was reported in the Owl Woods area to mid-month. The last Snowy Owl for the season was found just south of Ridge Road in the Town of Gaines on May 12th.

Typical of recent years, many eyes looking located all of the really expected passerine species. The only "misses" were relatively rare species—White-eyed Vireo, Connecticut Warbler, and Yellow-throated Warbler, and a few that sometimes linger or continue migrating into May—Northern Shrike, Lapland Longspur, and Fox Sparrow. As usual, arrival dates were biased toward the 1st quartile relative to the 1985 Monroe County Checklist distributions, though there was a higher percentage in the interquartile range. There were no record early arrivals. Numbers again seemed generally poor, with a few notable bursts tallied. From personal observation and comments of others, there were too many very quiet times birding. Scanning through the eBird records, there are relatively few sizable counts. This is hard to interpret, as people are urged to report for the smallest areas and shortest time periods they are willing to list, with the idea one can aggregate up. However, that makes the individual numbers low relative to past day-lists, and how to aggregate becomes a subjective guess. Thrushes seemed particularly late and scarce, warblers a mix, and winter finches missing other than some Pine Siskins. Rarer reports included: Worm-eating, "Lawrence's", Prothonotary, Kentucky, and Prairie Warblers; Yellow-breasted Chat; Clay-colored Sparrow; and the first Western Meadowlark in many years. The Braddock Bay Bird Observatory banding station total was the lowest of the past 7 years, though only slightly below 2 years ago. However, comparing this year with the prior 6-year averages, most species numbers banded fell well within one standard deviation of the average and only 5 species were significantly different at more than two standard deviations—House Wren and Ruby-crowned Kinglet were up and Least Flycatcher, Yellow Warbler, and Yellow-rumped Warbler were down. A few other interesting notes include Blue Jay back to normal after last year's record high; Black-capped Chickadee sticking with alternate high and low years, this year low (6 vs. last year's 593 for the season); Winter Wren again alternating high/low years but opposite to the chickadees; Ruby-crowned Kinglet higher yet compared with last year; and sparrow species again mostly at the lower ends of their typical banding totals for the month.

Reminding again, those interested in more details can go to the table of Noteworthy Records on the RBA website then dig deeper into the banding tally for the spring season on the BBBO website or the hawk watch data at the Hawkcount site. The table and these notes are summaries of the month's data, which included over 89,512 eBird records, about 60 Geneseebirds posts other than those entered in eBird, the banding and hawk watch tallies, and other records submitted to the records committee. There were over 400 unique

observers contributing to eBird this month, with much of the increase related to Global Big Day participants.

Please send your reports by the 5th of the month to Andrea Patterson, 144 Greystone Lane, #24, Rochester, NY 14618.
