Total for the year to date	269	271	267.2

Notes:

1. The National Weather Service, Buffalo climate summary for Rochester summed up this month simply as a pleasant summer month. Temperatures in the first half of the month averaged normal and then warmed to an average 4° above normal for the last two weeks. Overall, temperatures averaged 67.9°F, 1.2° above normal. There were two records set, a tie of the high on the 10th at 94° and a tie of the low on the 14th at 41°. Precipitation totaled 1.48”, 1.86” below normal. There were eight days with measurable rainfall, three less than average. Thunderstorms were a bit above normal, but scattered and rated severe only on the 10th, 22nd-23rd, and 27th, and mostly missing the immediate Rochester area. Lake Ontario warmed to the upper 60s by month’s end. Lake levels were slowly dropping all month.

2. Weather conditions were generally good for birding, and NY BBA III was finally entering into the time when serious field work should get into full swing; the messy mix of migrants and breeding birds finally behind. The eBird records download, 63,911 culled to about 47,462 after removing out-of-region records, was nearly 50 % above that from last June. 208 species reported for the month is a record high for the month. All of the really expected species were reported. The few misses were species whose departure distributions have tails into early June or species which have become rare in recent years. The only regular resident not reported was Ruffed Grouse. Off-list rarities included: Laughing Gull, American White Pelican, a *plegadis* Ibis, and Sedge Wren. A rare for the season Glaucous Gull lingered.

3. Waterfowl were generally scarce and numbers low; only Wood Duck and Mallard were tallied at really high numbers, once each. Most of the noteworthy reports are either just departure dates or late records of species that have previously lingered occasionally late or even all summer. Another two Common Goldeneyes were added to that species’ rare June reports. Blue-winged Teal, a former lakeshore-marsh breeder, was reported from two near-lakeshore locations.

4. Next, we pass by the missing Ruffed Grouse and likely released Chukars to good numbers of cuckoos with increasing gypsy moth caterpillars to both Common Nighthawk and Eastern Whip-poor-will reported into the month, though still with none likely breeding. With the cattails far

diminished, Common Gallinule and American Coot numbers were way down in the NMWMA (Van Dyne Spoor Rd.) area. Sandhill Cranes continued in known sites but with no young reported

5. Late spring shorebird variety was much as expected, with the usual migrants in June. Nineteen shorebird species were reported. There were a few more than usual dates that remain open to interpretations as to whether late departures, early arrivals, or individuals simply aborting the trip north. Numbers were very low other a decent count for Ruddy Turnstone and several good counts for Semipalmated Sandpiper. Moving to the larids, reports of note were a Laughing Gull, two Lesser Black-backed Gulls, and a Glaucous Gull, reported through the first half of the month at several Lake Ontario shore locations. Tern counts were relatively low. One Red-throated Loon and a few Common Loons lingered into the month. American White Pelican was reported in the NMWMA (Sandhill Crane Unit) from 11-17 June, with a *plegadis* ibis not identified to species also passing on the 17th. Black Vulture was not reported.

6. Among the raptors, the expected species were reported, with good numbers for Bald Eagle and Red-tailed Hawk, no reports for Northern Goshawk, and a lone Red-shouldered Hawk. The continuing hawk count at Braddock Bay logged a nice day on the 23rd, with 21 Bald Eagles, 10 Broad-winged Hawks, and 16 Red-tailed Hawks. Red-headed Woodpecker was reported from about 13 sites; likely a result of Atlas work. There were two reports of nesting pairs of Merlin from the Towns of Ontario and Williamson in Wayne County and seven total reports. There were only about five Peregrine Falcon reports from four locations other than the breeding pair in Rochester. The rfalconcam website reported that four young hatched, one died, and the others fledged – one on the 11th and two on the 16th. All were doing well at month's end.

7. This year, essentially all of the typical late migrants were reported in good numbers, many banded, into early June, including; Olive-sided, Yellow-bellied, and "Traill's" Flycatchers; Philadelphia Vireo; Gray-cheeked and Swainson's Thrushes; Lincoln's, White-throated, and White-crowned Sparrows; Tennessee, Mourning, Magnolia, Bay-breasted, Blackpoll, Canada, and Wilson's Warblers. Numbers banded for Yellow-bellied and "Traill's" Flycatchers were peak for the season and for Gray-cheeked Thrush were the only ones banded this spring. Rarer passerines for this season, some noted earlier, were Sedge Wren, a record late Ruby-crowned Kinglet in Mendon Ponds Park, Clay-colored Sparrows at the usual Cook Rd. sites in Hamlin plus Reed Rd. in Chili, the nesting Prothonotary Warbler on Armitage Rd. in the NMWMA, Northern Parula in Letchworth SP, a very late Palm Warbler and a first for June in Monroe County Yellow-throated Warbler both in Hamlin Beach SP, and Prairie Warblers at four sites. Again this year, departure dates were generally typical and peak counts in most cases low, with a few presented in the Noteworthy Records table. A surprise was a number of good counts for Cedar Waxwing in the 3-6 June period along the Lake Ontario shore.

8. Please submit reports to eBird, post them on geneseebirds, and/or send by the 5th of the month to Andrea Patterson, 144 Greystone Lane, #24, Rochester, NY 14618.
